

ABSTRACT OF THE DISCLOSURE

00769371.00201

A camera and a camera reset device comprises a liquid crystal display unit that displays the camera setting and/or control state, a mode dial operated to select at least one mode setting position at which a function (P, CSM, ISO or the like) related to or not related to a photographing operation can be selected and set, a command dial operated to select and set the function, a reset operation unit that resets the function to a specific initial state (by depressing an exposure compensation button and a bracketing button at the same time) and an arithmetic operation circuit that indicates a reset by temporarily turning off the display at the liquid crystal display unit or the like when the reset operation unit has been operated.
